It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          NOTE: This is a 'working draft' sequence. It currently consists of 14 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as
                                                                                                                                                                                                                                                                                                                                                                                                                                       186651

The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NOTE: This is a 'working draft' sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 45498: contig of 45498 bp in length

                                                                                                                                                                                                                                                                                                        consists of 14 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Molecular epidemiology of human T-cell leukemia virus type I

(HTLV-1) Brazil: the predominant HTLV-1s in South America differ from HTLV-1s of Japan and Africa, as well as those of Japanese immigrants and their relatives in Brazil

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the DNA sequence of vector ptrAp3. This mammalian expression vector contains a cDNA encoding human placental alkaline phosphatase (AP, see w55047) lacking a signal sequence. When the ptrAp3 is transfected into a mammalian cell line, such as COS7 cells, AP protein is neither expressed nor secreted since the AP cDNA of ptrAp3 does not encode a signal peptide or a membrane coll anchor sequence. However, insertion of a cDNA encoding a signal peptide sequence into ptrAp3 facilitates the expression and secretion of AP upon transfection of the DNA into mammalian cells. The presence of AP activity in the supernatants of transfected cells therefore indicates the presence of a signal sequence in the cDNA of interest. This forms the basis of a novel method for the cDNA of interest. This forms the basis of a novel method for the sequence, i.e. secreted or membrane-associated proteins of potential therapeutic value. An isolated clone (see V27707), designated ethb01016f2, was isolated using the novel method and condess a human neural adhesion protein (see w55045) protein having multiple, consecutive IgG domains. The method is very sensitive automation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

This sequence is used in a plasmid for regulation of gene expression, and treatment of viral infection pref. human T-cell leukaemia and HIV. The plasmid also encodes a protein which is used as an antivirus agent, and also in a method for detecting cancer. The DNA molecule and protein have potential uses in gene therapy, and the plasmid may also have potential use in the treatment of TSP.

Diagnosis of human leukaemia and/or lymphoma and virus infection made with part or all of the recombinant DNA. Virus antigenic proteins can be produced. These peptides and proteins, and antibodies against them, are useful for the diagnosis, therapy are prevention of human leukaemia.
                                                                                                                                                                      Viral genomic DNA complementary to RNA of human leukaemia virus useful in recombinant DNA producing therapeutic and diagnostic

                                     The present sequence is used in the plasmid vectors of the invention. The vectors which comprise a gene which can induce apoptosis under specific conditions, e.g. guanine phosphoribosyltransferase (gpt)), or a reporter gene, e.g. luciferase, where the gene is situated downstream of a promoter which responds to specific extracellular stimulation such as the presence of a cytokine, e.g. tumour necrosis factor (TNF) or interleukin-1: The vector may be used to transform a suitable cell line, such as a cell line which does not produce hypoxanthine-guanine phosphoribosyl transferase (HGPRT). The transformed cells are used to test the inhibitory effect of a gene or
                                                                                                                                                                                                                                                                                           WPI;
                                                                                                                                                                                                                     Test system for detecting intra-cellular signal transmission inhibition - using vector containing apoptosis-inhibiting or reporter gene and promoter sequence, used for, e.g. screening potential anti-inflammatory agents
                                                                                                                                                                                             Disclosure; Fig 7; 62pp; Japanese.

                          (Q50835) shows cDNA prepared from RNA extracted from a HTLV-1 infected cell. This was amplified by PCR and was used to construct p21x cDNA (Q50836). Primers and probes were then manufactured p21x cDNA (Q50836).
Sequence 1675 BP;
                                                                    Claim 1;

                                                                                    1697
                                                                                                                                                                                                                                                (Q50835) shows cDNA prepared from RNA extracted from a HTLV-1 infected cell. This was amplified by PCR and was used to construct p21x cDNA (Q50836). Primers and probes were then manufactured (Q50837-43), these are useful for the detection of HTLV-1 infection.
                                                                                                                                                                                                                                                                                                                           Oligo-nucleotide primer - for detecting mRNA of human leukemia virus 1 by polymerase chain reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Q50835 standard; cDNA; 1866 BP

                                                                                                                  Matches
                                                                                                                                                                                                                         methods for the expression and co-amplification of genes encoding recombinant proteins in cultured cells. The methods permit the isolation of cell lines which have co-amplified input recombinant sequences which encode an amplifiable marker, one or more expression vectors encoding a protein of interest and optionally a selectable marker. The amplified cells provide large quantities of recombinant proteins suitable for immunotherapy for treatment or lymphomas and leukaemias. The methods permit the production of custom vaccines, including multivalent vaccines that reflect the degree of somatic variation found in a patient's tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                            SR alpha enhancer/promoter in plasmid pcDL-SR alpha 296. The SR alpha enhancer/promoter is composed of human T cell leukaemia virus 15' untranslated sequences and the SV40 enhancer. It is reported to increase expression from the SV40 enhancer/promoter by 10-fold in host cells, and is active in a broad range of cell types. The SR alpha enhancer/promoter has been utilised in
                                                                                                                                                                                                                                                                                                                                                                                               expression vectors designed for efficient expression of genes in eukaryotic cells. The invention provides vectors and improved

                      with a vector comprising a polynucleotide coding for RNA which is complementary or homologous to a nucleic acid sequence within at least one gene from the retroviral genome and which inhibits replication of the retrovirus. Particularly preferred target genes are those coding for the ENV, POL, GAG proteins. Antisense sequences may also target the ART and TAT splice sites, the region around the translation initiation codon (AUG) or the primer binding site (PBS) of the retrovirus. The method is especially intended to confer resistance to infection by human immunodeficiency virus (HTV), feline leukaemia virus (FeLV) or human T lymphotropic virus 1 (HTLV-1). This sequence is from the long terminal repeat of HTLV-I and represents a target for inhibitory nucleic acid of the
                                                                                                                                                                                                                                                       Conferring resistance to retro-virus infection upon host cells using polynucleotide which directs transcription of RNA which inhibits replication

```

The sequences given in Q68397-99 represent fragments of the HIV, HTLV-1 and FeLV genomes which include the long terminal repeats (LTRs). These sequences were used as target fragments in the me

repeats in the method

and These

The method confers resistance to retroviral infection upon a host cell by inhibiting at least one step in the infection process, esp. retroviral replication, reverse transcription, and translation. A polynucleotide is introduced into the host cell and transcribed. The polynucleotide is complementary to a region of the retroviral genome selected from the 37-region, the primer binding site, the AUG start codon region and the RNA splice sites. This method can be used to prevent and to treat

Antisense ollgonucleotides against these polynucleotides are used in a method for conferring resistance to retroviral infection on a host cell. The antisense sequences are transfected into the host cell to prevent viral replication by binding to a site important for this process, e.g. the LTR, PBS (primer binding site), R region (essential for the "first jump" of reverse transcription), start codon or certain sites in the 3 and 5 untranslated regions. Resistant cells can be introduced into a patient, e.g. by bone marrow transplant to provide protection against retroviral infection.

No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
The present sequence is that of eukaryotic expression vector plasmid pCMV-MC1. The plasmid is derived from pCMVbeta by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cytomegalovirus (CMV) immediate early promoter was accomplished by substituting the sequence between SacI and the 2nd NotI site of CPCMV-MC1 with a synthetic linker. North American porcine reproductive and respiratory syndrome (PRRS) virus P129A cDNA (see A27809) was cloned into the modified vector to create pcMV-S-P129 (ATCC 203489), which was used to demonstrate cellular expression of PRRS virus by direct transfection of cDNA into cells. The invention relates to polynuclectide molecules, plasmids, viral vectors and transfected host cells that comprise North American PRRS DNA. It also relates to polynucleotide molecules, viral vectors and transfected host cells encoding a genetically modified North American PRRS virus that is disabled in its ability to cause PRRS, or which encodes 1 or more heterologous antigenic epitopes,

Commonly used reporter genes include beta-galactosidase, firefly luciferase, alkaline phosphatase; chloramphenicol acetyltransferase (CAT), and beta glucuronidase (GUS). However, these have limitations in their use. Frequently, these reporter genes require the addition of a substrate and the size of certain proteins means that the expression of reporter fusion proteins means that the expression of reporter fusion proteins can be difficult. The light stimulated Grp

                                                                                                                                                                                                                                                                                                                                                                in vivo, to label specific cells in multicellular organisms (e.g. to study cell lineage's), to label and locate fusion proteins, and to study intracellular trafficking. Commonly used reporter genes include beta-galactosidase, firefly luciferase, alkaline phosphatase; chloramphenicol acetyltransferase (CAT), and beta glucuronidase (GUS). However, these have limitations in their use. Frequently, these reporter genes require the addition of a substrate and the size of certain proteins means that the expression of reporter fusion proteins can be difficult. The light stimulated GFP fluorescence is species independent and does not require any cofactors substrates or additional gene products from Aeguorea victoria an as the GFP genes have been humanised, they are expressed at sufficient levels to be detectable in human cells, unlike previous GFP proteins.
